Why do we need a grid-scale energy-storage system?

Under some conditions,excess renewable energy is produced and,without storage,is curtailed 2,3; under others,demand is greater than generation from renewables. Grid-scale energy-storage (GSES) systems are therefore needed to store excess renewable energy to be released on demand,when power generation is insufficient4.

What is grid-scale storage?

Grid-scale storage refers to technologies connected to the power grid that can store energy and then supply it back to the grid at a more advantageous time - for example, at night, when no solar power is available, or during a weather event that disrupts electricity generation.

Are battery energy-storage technologies necessary for grid-scale energy storage?

The rise in renewable energy utilization is increasing demand for battery energy-storage technologies (BESTs). BESTs based on lithium-ion batteries are being developed and deployed. However,this technology alone does not meet all the requirementsfor grid-scale energy storage.

What types of battery technologies are being developed for grid-scale energy storage?

In this Review,we describe BESTs being developed for grid-scale energy storage,including high-energy,aqueous,redox flow,high-temperature and gas batteries. Battery technologies support various power system services,including providing grid support services and preventing curtailment.
