What is a building microgrid?

A building microgrid's capacity is usually around hundreds of kilowatts, and they have an active role in partial-to-full electricity supply to buildings via onsite energy supply components, such as solar PV, battery energy storage systems (BESS), and diesel generators (DG) .

What is the literature on building microgrids?

Literature on building microgrids focuses primarily on grid-connected solar PV, with and without battery storage system, given that most office and commercial buildings have peak power demand during the daytime and in the context of net zero energy buildings .

How reliable is a building microgrid?

The building microgrid without DG demonstrates a robust reliability, with approximately 10% more probability of surviving outages than the microgrid with DG. For outages lasting more than 4 h, the probability of surviving outages increases at additional costs.
