What is a nickel cadmium battery?

The nickel-cadmium battery uses nickel hydroxide as the active material for the positive plate, and cadmium hydroxide for the negative plate. The electrolyte is an aqueous solution of potassium hydroxide containing small quantities of lithium hydroxide to improve cycle life and high temperature operation.

Why is nickel cadmium battery better than lead acid battery?

Thus, through its electrochemistry, the nickel-cadmium battery has a more stable behavior than the lead acid battery, giving it a longer life, superior characteristics and a greater resistance against abusive conditions. 4. Construction features of the block battery

Does nickel cadmium battery have potassium hydroxide?

In the charge/discharge reaction of the nickel-cadmium battery, the potassium hydroxide is not mentioned in the reaction formula. A small amount of water is produced during the charging procedure (and consumed during the discharge).

What is a nickel cadmium cell?

fulfill all requirements specified 60623. The nickel-cadmium cell consists of two groups of plates, the positive containing nickel hydroxide and the negative containing cadmium hydroxide. The active materials of the Saft Nife pocket plate block battery are retained in pockets formed from steel strips double-perforated by a patented process.
