Are lithium-ion batteries safe to operate without BMS protection?

A: Operating lithium-ion batteries without proper BMS protection is extremely dangerous and not recommended. While basic protection circuits exist, they lack the comprehensive monitoring and management capabilities needed for safe operation.

How does a battery communicate with a BMS?

The battery communicates these alarms to the BMS via its BMS cables. The BMS receives an alarm signal from a battery cell. If the system contains multiple batteries, all battery BMS cables are connected in series (daisy chained). The first and the last BMS cable is connected to the BMS.

What happens if a BMS is under voltage?

In case of an imminent under-voltage shutdown, the pre-alarm output of the BMS will switch on. In case the voltage continues to decrease, the loads are switched off (load disconnect) and at the same time, the pre-alarm output will switch off again.
