-----  
How deep should a server rack be?

However, these are not ideal for full size servers. If you're managing heavy workloads or using large equipment, you'll likely need a full depth server rack around 42" or 48" deep to ensure compatibility. Understanding the nuances between each size choice helps you choose the rack that accommodates your space, hardware, and airflow requirements.

How big is a server rack?

At 46 inches (1168 millimeters) deep, this rack can accommodate large servers and other equipment of equivalent mass. The rack's 800-millimeter (31.5-inch) width provides side channels for mounting accessories, more room for routing cables and increased airflow to help keep equipment cool.

How deep is a server cabinet?

Server cabinets are commonly found in a few standard depth measures, including 600mm (23.6"), 800mm (31.5"), 1000mm (39.4"), and 1200mm (47.2"). Standard server rack dimensions for depth would typically range between 800mm to 1200mm for full sized enterprise solutions.

What happens if a rack is too deep?

Too short standard rack depth produces overhang, with equipment extending beyond the rear of the rack. It is a safety risk as well as an equipment stability hazard. Alternatively, too deep racks will be unnecessarily large and harder to place in cramped IT closets or office space.

The SRK Data Series Cabinets have the capacity and quality to meet modern IT Data Center requirements for high density computing and networking. ...

The 42U NavePoint Commercial Series network server cabinets have capacity and quality --everything it takes to get the job done right for your ...
