OverviewTypesCompressors and expandersStorageEnvironmental ImpactHistoryProjectsStorage thermodynamicsCompression of air creates heat; the air is warmer after compression. Expansion removes heat. If no extra heat is added, the air will be much colder after expansion. If the heat generated during compression can be stored and used during expansion, then the efficiency of the storage improves

considerably. There are several ways in which a CAES system can deal with heat. Air storage can be adiabatic, diabatic, isothermal, or near-isothermal.

Compressed Air Energy Storage costs 26c/kWh as a storage spread to generate a 10% IRR at a \$1,350/kW CAES facility, with 63% efficiency.
